

PRD: Nova Document Agent

Target Personas

Persona: The CG (Priya, Senior Cargo Validator)

- Handles a high-volume daily influx of 40–80 SU emails, each containing critical attachments like BOLs, Invoices, and Packing Lists.
- Currently performs manual PDF extraction, cross-referencing fields against memorized business rules and drafting individual amendment requests by hand.
- **Phase 2 Objective:** Transition her workflow from manual reading to high-level decisioning. She requires instant structured verification upon email receipt and pre-drafted replies, turning her inbox into a prioritized decision queue.

Persona: The SU (Raj, Export Logistics Coordinator)

- Operates on a "send and forget" basis via email, with document submission marking the end of his active task involvement.
- Suffers from long feedback loops, typically receiving amendment requests 12–24 hours post-submission, often while cargo is already in transit.
- **Phase 2 Objective:** Minimize lead time for corrections. He needs immediate notification of submission errors and granular, actionable feedback to ensure compliance in a single pass.

Jobs-to-be-Done (JTBD)

- **For the CG Operator:** When SU's email arrives with attachments, I want the agent to automatically validate all documents and present me a field-by-field result with a draft reply, without me opening the email or reading a single PDF, so that I can review and send the response in under 2 minutes instead of 20.
- **For the SU Manager:** When my submitted documents have a discrepancy, I want to receive a structured amendment email within minutes, listing the exact field, what I submitted, and what's expected, so that I can correct and resubmit before the shipment window closes, without a back-and-forth cycle.

North-Star Metric

CG time-to-decision

Average time from SU email received to CG review-and-send (draft reply sent or approval confirmed).

Target: under 5 minutes, down from the current 30–60 minute average.

Critical Failure Mode & Mitigation

Failure Mode: Silent cross-document approval

Three docs arrive - BOL, Invoice, Packing List. The HS code on the Invoice doesn't match the BOL. The agent validates each doc independently, both pass individually, the agent drafts an approval email. CG sends it. The shipment is held at customs because the HS codes are inconsistent.

Prevention: The cross-document consistency check (Phase 2's new logic) must run before the Router decides. Any field that appears in more than one doc and doesn't match across docs must be flagged as uncertain, never silently approved. The agent never sends on its own; CG always reviews first.
